

Sending emails with Paxton10

Overview

For Paxton10 to send emails, such as emailing a roll call report, it is required to enter the details of an email server for Paxton10 to use.

An email server is not required for issuing Smart credentials or forgotten password requests – these emails are sent using Paxton's own secure email server.

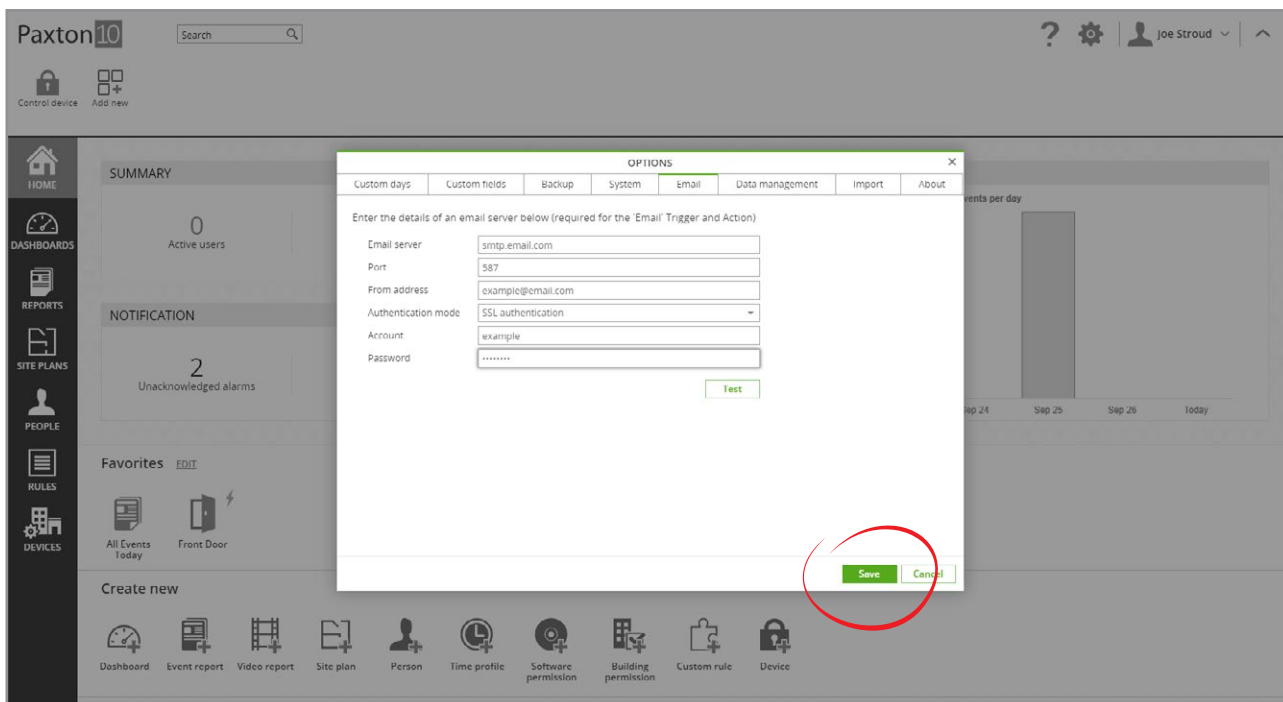

What is an email server?

An email server is an application, either hosted remotely (such as Google mail or Yahoo! Mail), or in the case of large businesses, can be running on a local machine that handles the sending and receiving of emails.

Configure the email server with Paxton10

The email configuration is within the Options menu, which requires a user with System Engineer permissions to access.

1. Click the '**System options**' icon to open the options window, then select '**Email**'
2. Enter the '**Email server**' (e.g. smtp.mail.com) and the port number (e.g. 587)
3. Enter the email address for your account. If the email account hosts multiple addresses, specify the address the emails should appear to be from
4. Select the type of authentication required, and enter your username and password that you use to access your email account
5. Click '**Test**' and enter a valid email address to send out a test email to ensure the details entered are correct
6. Click '**Save**'
